BUFF™

DESCRIPTION

BUFF™ is a drycleaning solvent treatment additive designed to combat the adverse effects of free fatty acid formation in the drycleaning system. **BUFF™** also helps buffer solvent that has become “destabilized”/acidic through the distillation process and provides significant anti-static capabilities.

APPLICATION

Buteric and valeric short chain fatty acids accumulate in solvent systems through the drycleaning process and in the presence of moisture, often cause mal odors, swails, and/or poor cleaning results.

BUFF™ is a concentrated powder additive that has the ability to buffer these fatty acids and “sweeten” perchlorethylene and hydrocarbon solvent systems providing the following benefits.

- Static electricity reduction
- Reduced linting
- Buffers system pH to reduce machine and system corrosion
- Deodorizes solvent
- Does not adversely affect filter pressure

USAGE

BUFF™ is used as received on a once-daily basis at the rate of approximately 3 oz. per 50 lbs. of drycleaning machine capacity. More or less may be appropriate dependent upon solvent condition, garment tonnage, and free fatty acid buildup.

PACKAGING

BUFF™ is packaged in 4 x 10 lb. wide mouth jars with a 2 oz. application scoop.
