MID-CAP™

DESCRIPTION

MID-CAP™ is a concentrated, coconut oil based odor-counteractant/detergent, and solvent additive specifically developed for the mitigation of organic based garment odors encountered in general cleaning and/or textile/smoke restoration processing.

MID-CAP™ utilizes state of the art molecular encapsulation technology to eliminate and control odors while simultaneously providing “fiber-feedback” to garments thereby replacing the oils typically lost in solvent processing.

MID-CAP™ may eliminate the need for the time and space consuming ozone processes currently used by many fire restoration providers.

Additionally, **MID-CAP™** will create a uniformly suspended emulsion when exposed to moisture in the solvent system, thereby preventing shrinkage, and contributing to static electricity reductions due conductance of the electrical charges to ground.

USAGE

Usages rates will vary depending on odor level and smoke damage.

On heavy smoke loads, a batch/dosage range of 20 – 25 oz. per 50 lb. load of garments is generally recommended.

For loads containing light soil, but laden with persistent body odors, a dosage of 1-2 oz. / 10lbs of garments being processed is recommended, and would preferably be utilized in the second bath of two bath wash cycles.

MID-CAP™ is effective in perc or hydrocarbon solvent, however the lower end of the dosage range should be employed in hydrocarbon systems.

A heavy-soil treatment program should be run as a two bath operation as follows:

Bath 1 – Run as a batch “off” filter for 6 – 8 minutes with Pariser P.O.G. or TASKMASTER at a dosage rate of one half to a one gallon depending on the level of soot. Then drain to still.

Bath 2 – Run “on” filter for 8 – 10 minutes with recommended dosage of **MID-CAP™**, then drain to work tank, extract and dry.

PACKAGING

MID-CAP™ is packaged in 1 gallon containers, four (4) to a case, 5 gal pails and 15 gallon drums.
